Modeling Climate Change Over Time

Japheth Carlson, Andy Criddle, Nathan Longhurst, Ethan Palenske

Brigham Young University

Introduction

Do the presenters begin with a well-motivated explanation of the background for the problem, why it is interesting, and what techniques/methods have been previously used (if any) for this problem or similar ones?

So, why should we care?

Introduction

Do the presenters begin with a well-motivated explanation of the background for the problem, why it is interesting, and what techniques/methods have been previously used (if any) for this problem or similar ones?

So, why should we care?

Data

Does the presentation address the sources, reliability, and suitability of their data for the problems they are addressing?

Data - A Falsified Dataset

- One Kaggle dataset claimed to use data from a reputable source

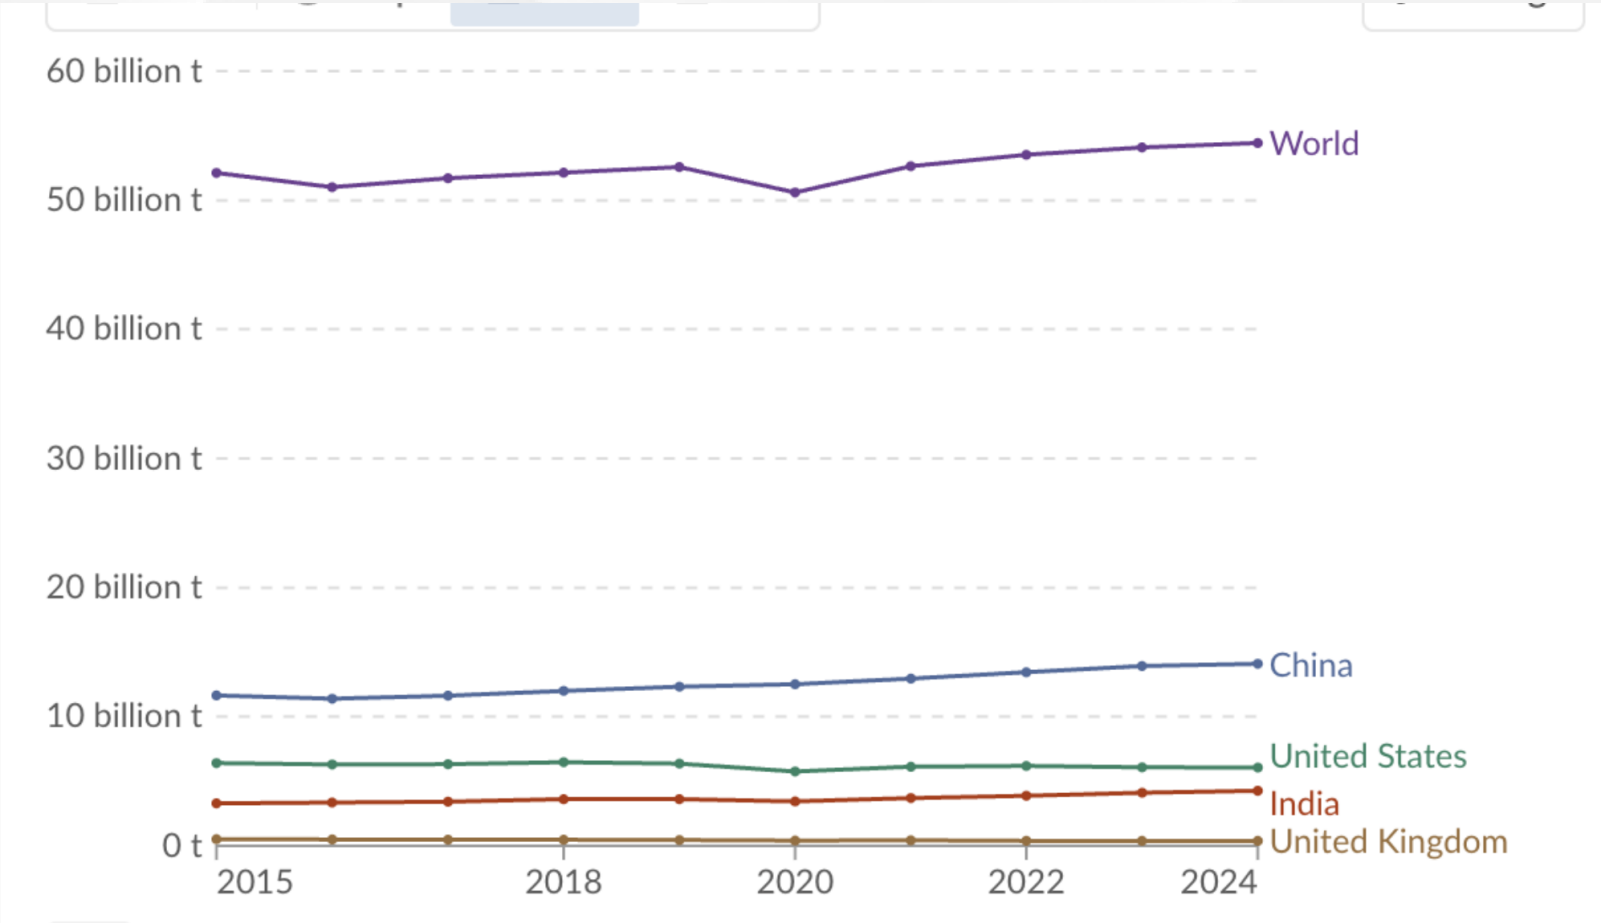
About this file

A csv with country and years as column.
Each row shows a country and its emission data from 1750 -2019 measured in tonnes.
Country column is String, while other columns are integer

Country Country Names	# 2017
231 unique values	 0 1580b
World	1.58E+12
United States	3.99E+11
EU-28	3.53E+11
China	2.00E+11
Asia and Pacific (other)	1.78E+11
Europe (other)	1.58E+11
Russia	1.01E+11

Data - A Falsified Dataset

- A graph from the actual source:



Methods

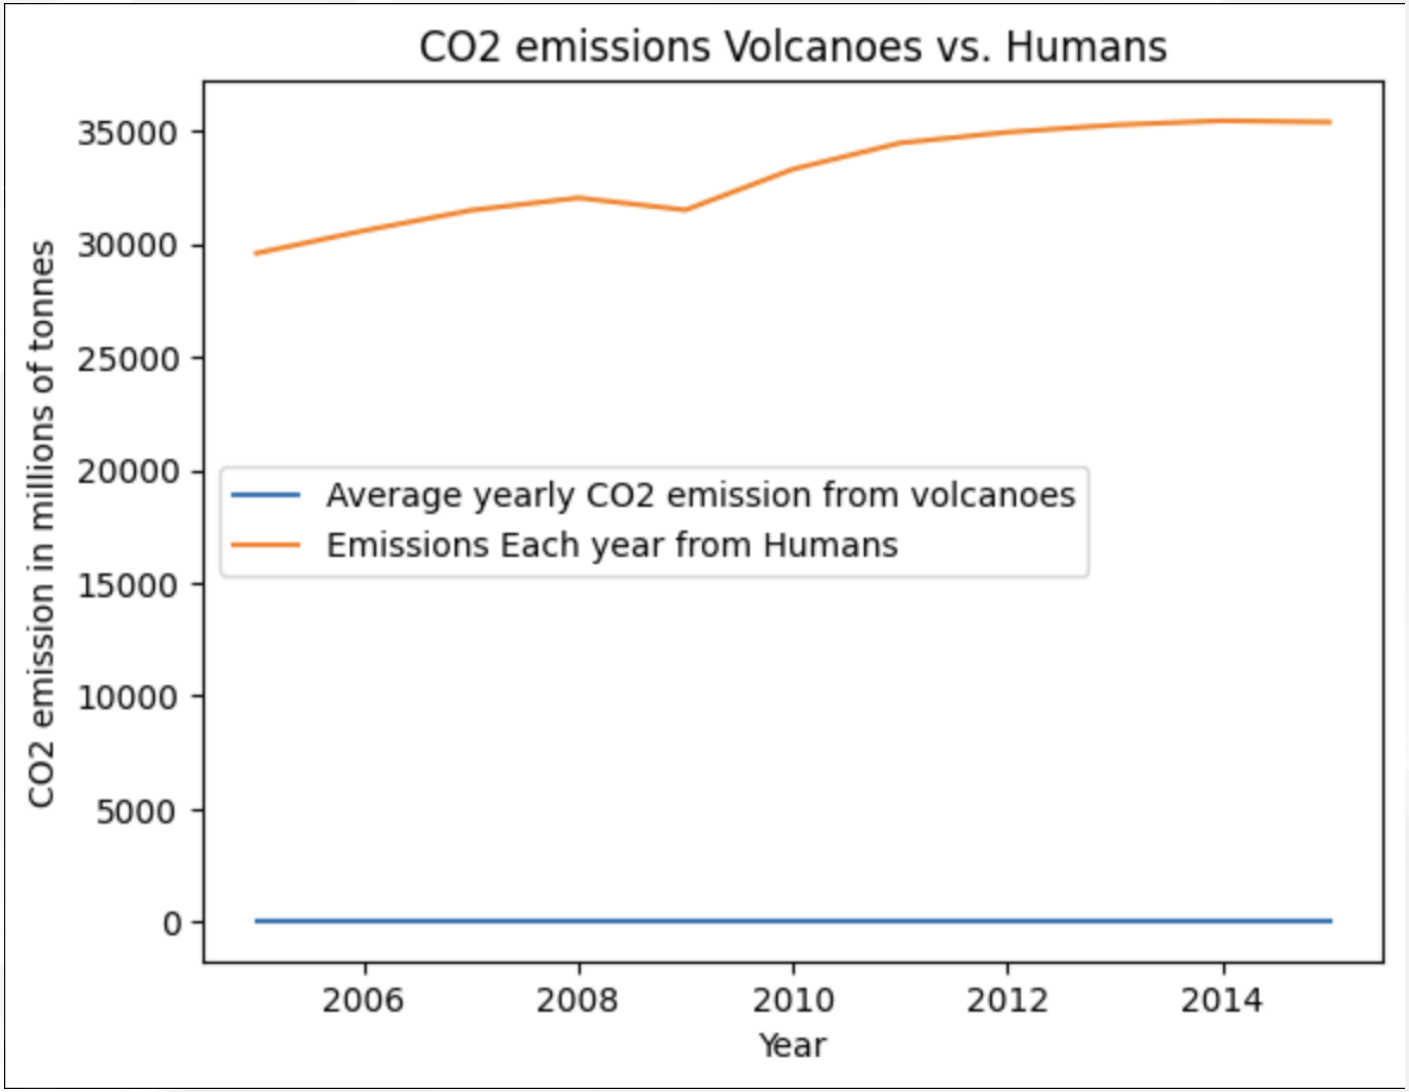
Do they clearly describe their methods and models and justify the choices they made? Does the presentation demonstrate a clear understanding of the principles involved and of the strengths and weaknesses of the models and methods used?

Results and Analysis - Volcanoes

- Is global climate change due primarily to volcanoes?

Results and Analysis - Volcanoes

- Is global climate change due primarily to volcanoes?



Results and Analysis

Do they clearly and succinctly describe the results and their interpretation and analysis of the results? Does the presentation demonstrate a thorough understanding of the potential challenges and weaknesses of the methods and models? Do they clearly summarize the conclusions and outstanding open questions? Are the results significant or meaningful?

Results and Analysis (cont.)

BYU

What we accomplished:

Ethics

- Collecting data: **ethical**
- Ignorance of what the data indicates: **not ethical**
- Our results do not assign culpability to any individual person, industry or nation
- Everyone should hold themselves accountable
- Kaggle dataset; propoganda about global climate change is real

In analyzing our results, we do not hope to single any individual or group out for their actions. Rather, we encourage all people everywhere to develop a greater awareness of the long-term climate trends and what we each may do individually to improve our shared environment.

Thank you

Thank you for your attention
